

Module 16

# Hacking Wireless Networks

# Learning Objectives

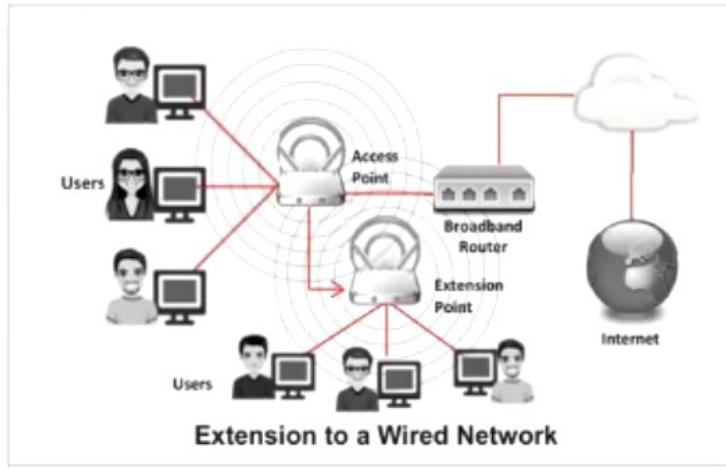

- 01** Summarize Wireless Concepts
- 02** Explain Different Wireless Encryption Algorithms
- 03** Explain Different Wireless Threats
- 04** Demonstrate Wireless Hacking Methodology
- 05** Explain Wireless Attack Countermeasures

Objective **01**

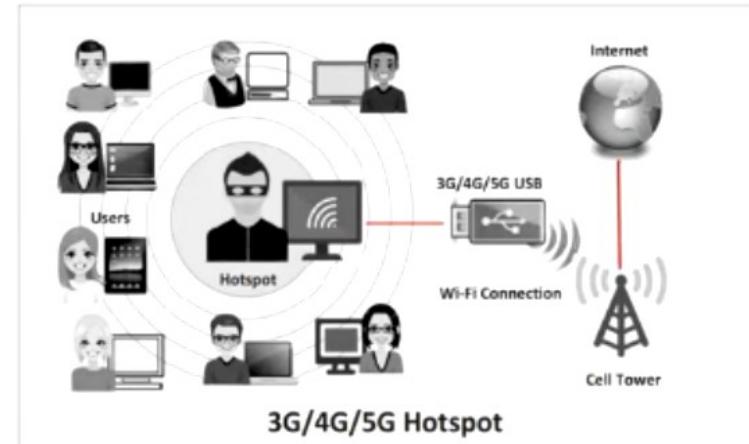

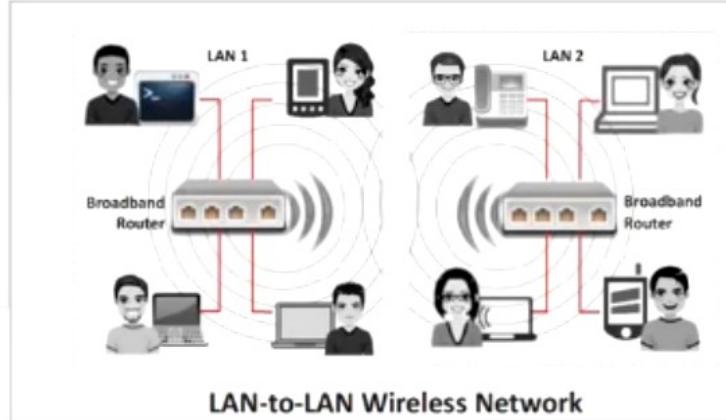

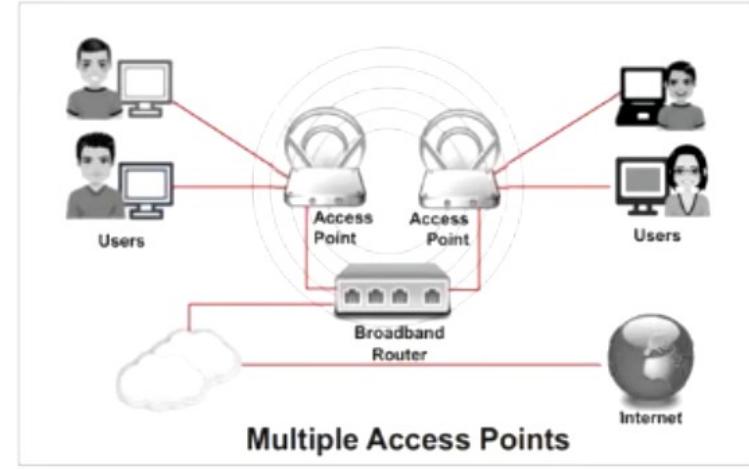

# Summarize Wireless Concepts

# Wireless Networks

- Wireless network (Wi-Fi) refers to WLANs based on **IEEE 802.11 standard**, which allows a device to access the network from anywhere within an **AP range**
- Devices, such as a personal computer, video-game console, and smartphone, use Wi-Fi to connect to a **network resource**, such as the Internet, via a **wireless network AP**

## Types of Wireless Networks

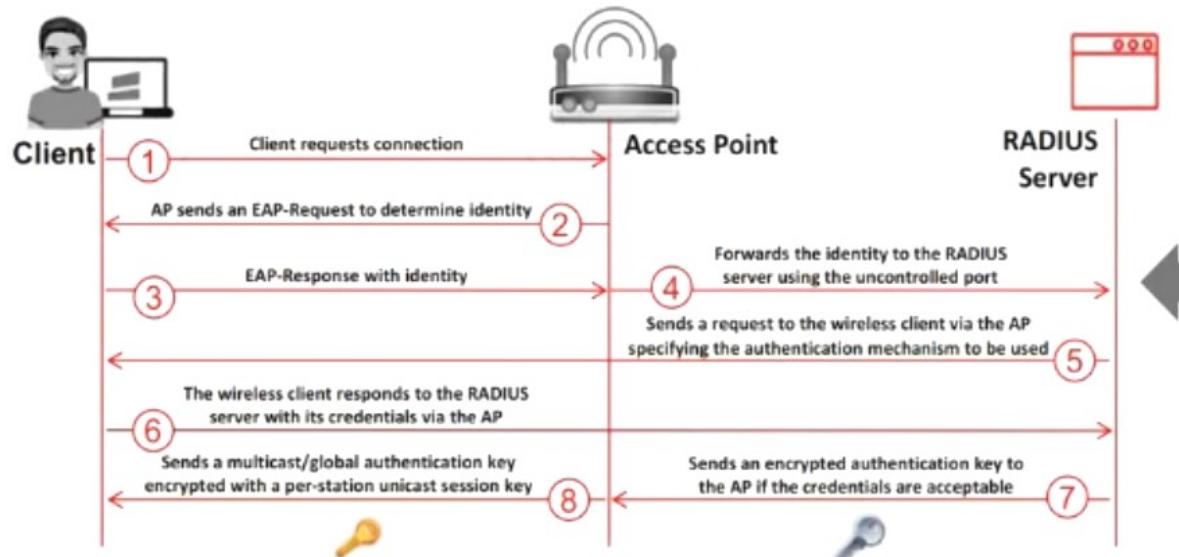

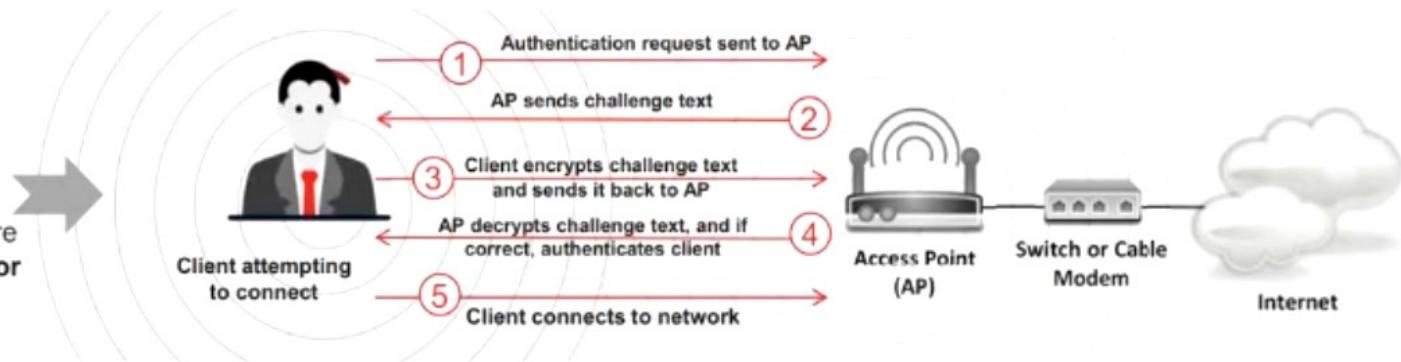

# Wireless Standards

Amendments	Frequency (GHz)	Modulation	Speed (Mbps)	Range (Meters)
802.11 (Wi-Fi)	2.4	DSSS, FHSS	1, 2	20 – 100
802.11a	5	OFDM	6, 9, 12, 18, 24, 36, 48, 54	35 – 100
	3.7			5000
802.11ax	2.4 to 5	1024-QAM	2400	240
802.11b	2.4	DSSS	1, 2, 5.5, 11	35 – 140
802.11be	2.4, 5, 6	QAM	3000	120
802.11d	It is an enhancement to 802.11a and 802.11b that enables global portability by allowing variations in frequencies, power levels, and bandwidth			
802.11e	It provides guidance for prioritization of data, voice, and video transmissions enabling QoS			
802.11g	2.4	OFDM	6, 9, 12, 18, 24, 36, 48, 54	38 – 140
802.11i	A standard for wireless local area networks (WLANs) that provides improved encryption for networks that use 802.11a, 802.11b, and 802.11g standards; defines WPA2-Enterprise/WPA2-Personal for Wi-Fi			
802.11n	2.4, 5	MIMO-OFDM	54 – 600	70 – 250
802.15.1 (Bluetooth)	2.4	GFSK, π/4-DPSK, 8DPSK	25 – 50	10 – 240
802.15.4 (ZigBee)	0.868, 0.915, 2.4	O-QPSK, GFSK, BPSK	0.02, 0.04, 0.25	1 – 100
802.16 (WiMAX)	2 – 11	SOFDMA	34 – 1000	1609.34 - 9656.06 (1-6 miles)

# Wi-Fi Authentication Process

## Pre-Shared Key (PSK) Mode

- Pre-Shared Key (PSK) Wi-Fi authentication mode, also known as WPA-PSK or WPA2-PSK, is a method used to secure wireless networks where a single, shared password is used for authentication

## Centralized Authentication Mode

- A centralized authentication server known as the remote authentication dial-in user service (**RADIUS**) sends authentication keys to both the AP and client that require authentication with the AP
- Each user is assigned **unique credentials**, providing enhanced security by **independently verifying** each user's access

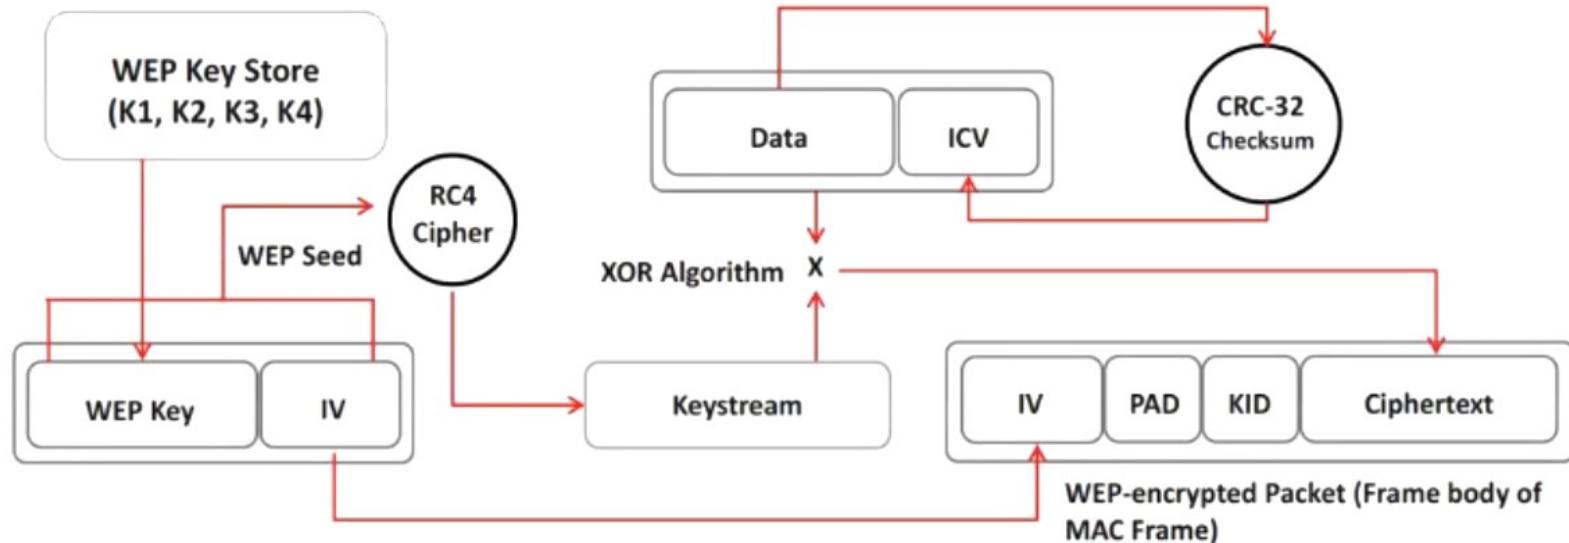

Objective **02**

# Explain Different Wireless Encryption Algorithms

# Wireless Encryption: Wired Equivalent Privacy (WEP)

- WEP is a security protocol defined by the 802.11b standard; it was designed to provide a wireless LAN with a level of **security and privacy** comparable to that of a wired LAN
- WEP **uses a 24-bit initialization vector (IV)** to form stream cipher RC4 for confidentiality and the CRC-32 checksum for integrity of wireless transmissions
- It has significant vulnerabilities and design flaws and **can therefore be easily cracked**

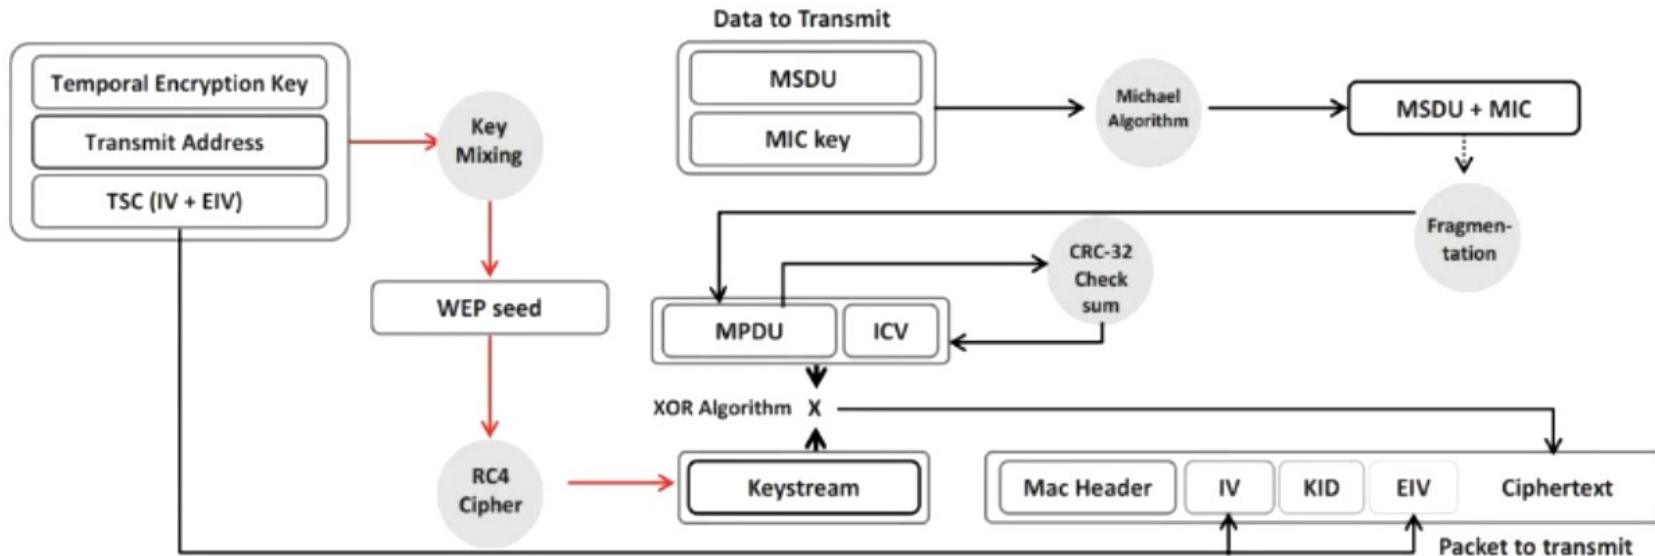

**How WEP Works**

# Wireless Encryption: Wi-Fi Protected Access (WPA)

- WPA is a security protocol defined by 802.11i standards; it uses a Temporal Key Integrity Protocol (TKIP) that utilizes **the RC4 stream cipher encryption** with 128-bit keys and 64-bit MIC integrity check to provide stronger encryption and authentication
- WPA uses TKIP to eliminate the weaknesses of WEP by including **per-packet mixing functions, message integrity checks, extended initialization vectors, and re-keying mechanisms**

## How WPA Works

# Wireless Encryption: WPA2

- WPA2 is an **upgrade to WPA**, and it includes mandatory support for counter mode with cipher block chaining message authentication code protocol (**CCMP**), an **AES-based encryption mode** with strong security

## Modes of Operation

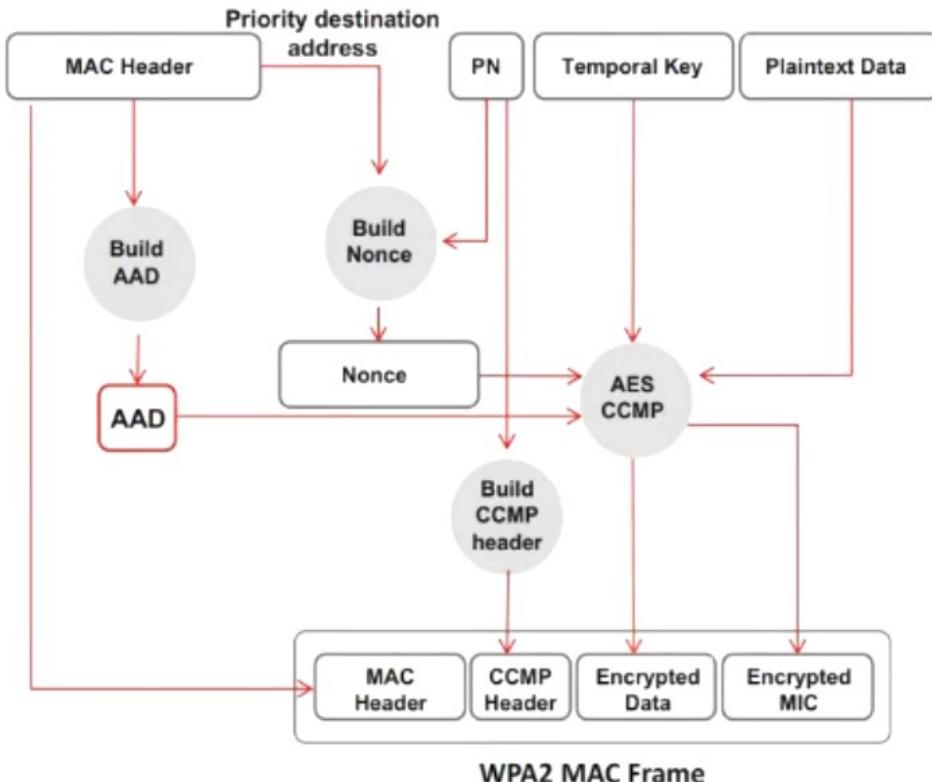

### WPA2-Personal

- It uses a set-up password (**pre-shared Key**, PSK) to protect unauthorized network accesses
- In PSK mode, each wireless network device encrypts the network traffic using a 128-bit key, which is derived from a passphrase of 8 to 63 ASCII characters

### WPA2-Enterprise

- It includes **EAP** or **RADIUS** for centralized client authentication using multiple authentication methods, such as token cards, and Kerberos
- Users are assigned **login credentials** by a centralized server, which they must present when connecting to the network

## How WPA2 Works

# Wireless Encryption: WPA3

- WPA3 is an advanced implementation of WPA2 providing trailblazing protocols and uses the **AES-GCMP 256** encryption algorithm

## Modes of Operation

### WPA3 - Personal

- It is mainly used to deliver **password-based authentication** using the SAE protocol, also known as Dragonfly Key Exchange
- It is resistant to offline dictionary attacks and key recovery attacks

### WPA3 - Enterprise

- It **protects sensitive data** using many cryptographic algorithms
- It provides authenticated encryption using GCMP-256
- It uses HMAC-SHA-384 to generate cryptographic keys
- It uses ECDSA-384 for exchanging keys

# Comparison of WEP, WPA, WPA2, and WPA3

Encryption	Attributes				
	Encryption Algorithm	IV Size	Encryption Key Length	Key Management	Integrity Check Mechanism
WEP	RC4	24-bits	40/104-bits	None	CRC-32
WPA	RC4, TKIP	48-bits	128-bits	4-way handshake	Michael algorithm and CRC-32
WPA2	AES-CCMP	48-bits	128-bits	4-way handshake	CBC-MAC
WPA3	AES-GCMP 256	Arbitrary length 1 - 2 <sup>64</sup>	192-bits	ECDH and ECDSA	BIP-GMAC-256

WEP, WPA	X	Should be replaced with more secure WPA2 and WPA3
WPA2	✓	Incorporates protection against forgery and replay attacks
WPA3	✓	Provides enhanced password protection and secured IoT connections; encompasses stronger encryption techniques

# Issues with WEP, WPA, WPA2, and WPA3

## Issues with WEP

- CRC-32 does not ensure complete cryptographic integrity
- IVs are 24 bits and sent in cleartext
- Vulnerable to **known plaintext attacks**
- Prone to **password cracking attacks**
- Associate/disassociate messages are not authenticated
- One can easily construct a decryption table of reconstructed key streams
- Lack of centralized key management
- IV is a part of the RC4 encryption key, which leads to an **analytical attack**

## Issues with WPA

- Pre-shared key is vulnerable to **eavesdropping** and dictionary attacks
- Lack of forward secrecy
- WPA-TKIP is vulnerable to **packet spoofing** and decryption attacks
- Insecure random number generator (RNG) in WPA allows the **discover of GTK** generated by AP
- Vulnerabilities in TKIP allow attackers to guess the IP address of the subnet

## Issues with WPA2

- Pre-shared key is vulnerable to eavesdropping and **dictionary attacks**
- Lack of forward secrecy
- Hole96 vulnerability makes WPA2 vulnerable to **MITM** and **DoS attacks**
- Insecure random number generator (RNG) in WPA2 allow attackers to **discover GTK** generated by AP
- **KRACK vulnerabilities** make WPA2 vulnerable to packet sniffing, connection hijacking, malware injection, and decryption attacks

## Issues with WPA3

- WPA3 uses more complex **encryption algorithms**, which can demand more **processing power** from devices
- Simultaneous **Authentication of Equals (SAE)** vulnerable to timing attacks
- Vulnerable to **cache-based side-channel attacks**, exposing sensitive information from **cache access patterns**
- Errors in configuration such as **weak passwords** and **poor network setup**, can leave networks vulnerable to intrusion, despite the advanced protections offered by **WPA3**

Objective **03**

# Explain Different Wireless Threats

# Wireless Threats

## Access Control Attacks

- Wireless access control attacks aim to penetrate a network by **evading WLAN access control measures**, such as AP MAC filters and Wi-Fi port access controls
- MAC Spoofing
- AP Misconfiguration
- Ad Hoc Associations
- Promiscuous Client
- Client Mis-association
- Unauthorized Association

## Integrity Attacks

- In integrity attacks, attackers **send forged control, management, or data frames over a wireless network** to misdirect the wireless devices to perform another type of attacks (e.g., DoS)
  - Data Frame Injection
  - WEP Injection
  - Bit-Flipping Attacks
  - Extensible AP Replay
  - Data Replay
  - Initialization Vector Replay Attacks
  - RADIUS Replay
  - Wireless Network Viruses

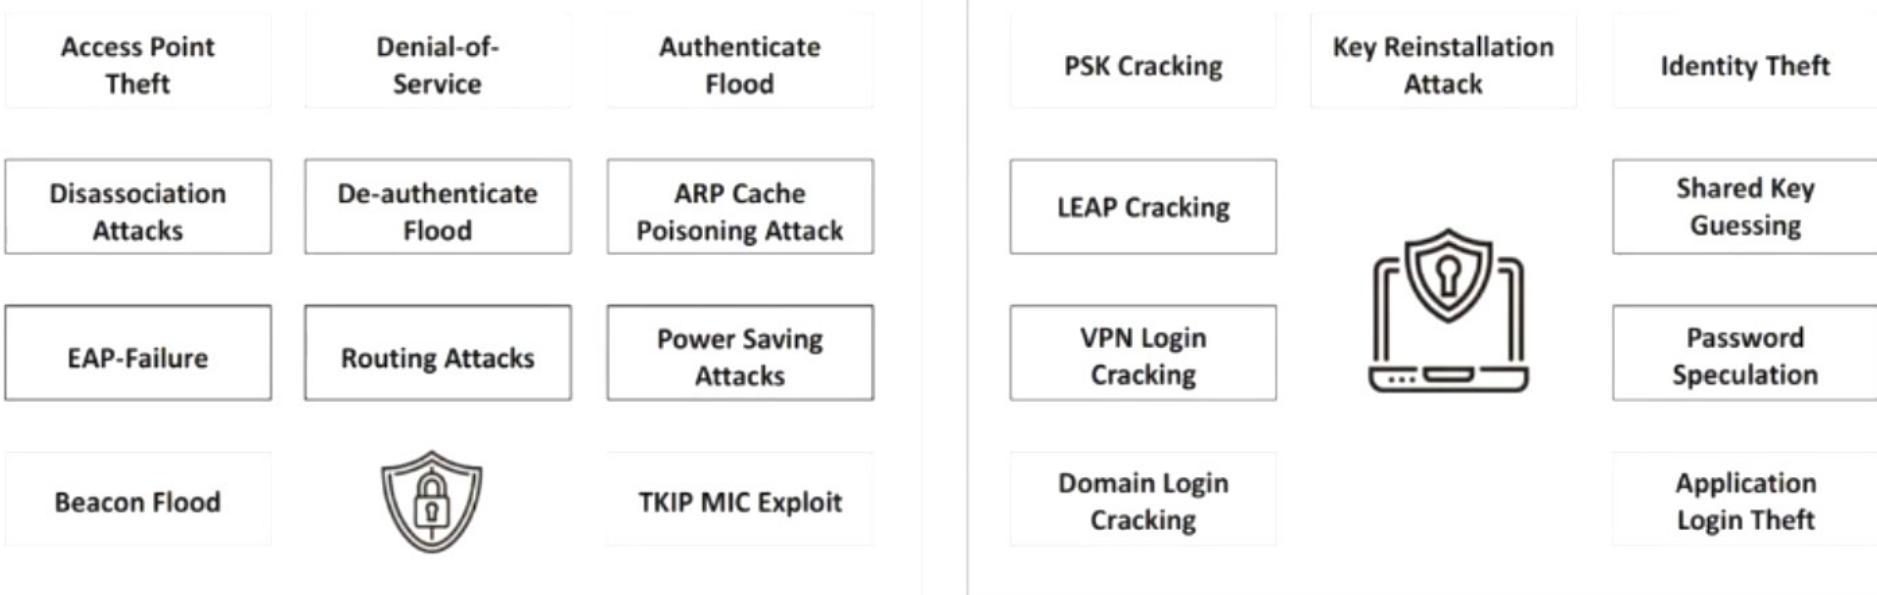

## Confidentiality Attacks

- These attacks attempt to **intercept confidential information sent over wireless associations**, regardless of whether they were sent in clear text or encrypted by Wi-Fi protocols
  - Eavesdropping
  - Traffic Analysis
  - Cracking WEP Key
  - Evil Twin AP
  - Honeypot AP
  - Session Hijacking
  - Masquerading
  - Man-in-the-Middle Attack

# Wireless Threats (Cont'd)

## Availability Attacks

- Availability attacks aim at **obstructing the delivery of wireless services to legitimate users**, either by crippling those resources or by denying them access to WLAN resources

Objective **04**

# Demonstrate Wireless Hacking Methodology

# Wireless Hacking Methodology

- The objective of the wireless hacking methodology is to **compromise a Wi-Fi network** to gain unauthorized access to network resources

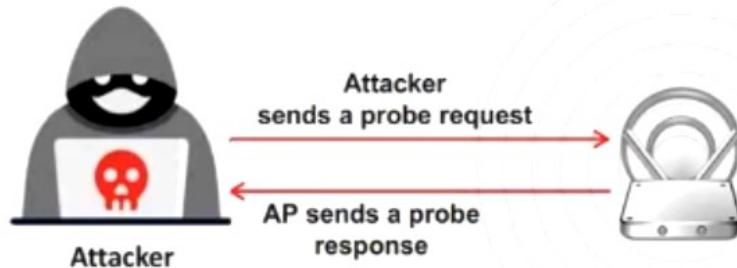

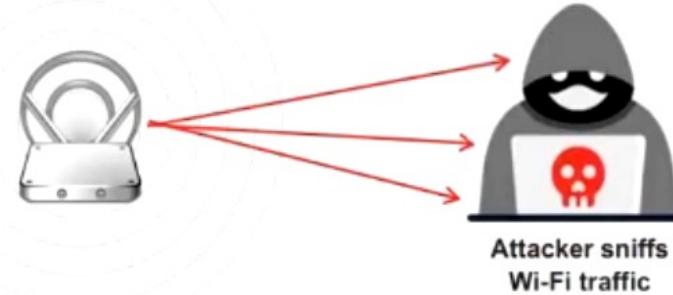

- 1 Wi-Fi Discovery
- 2 Wireless Traffic Analysis
- 3 Launch of Wireless Attacks
- 4 Wi-Fi Encryption Cracking
- 5 Compromise the Wi-Fi Network

# Wi-Fi Discovery: Wireless Network Footprinting

- Attacking a wireless network begins with **discovering** and **footprinting** the wireless network actively or passively

## Passive Footprinting Method

An attacker can passively **detect the existence of an AP** by sniffing the packets from the airwaves, which will reveal the AP, SSID, and attacker's wireless devices that are live

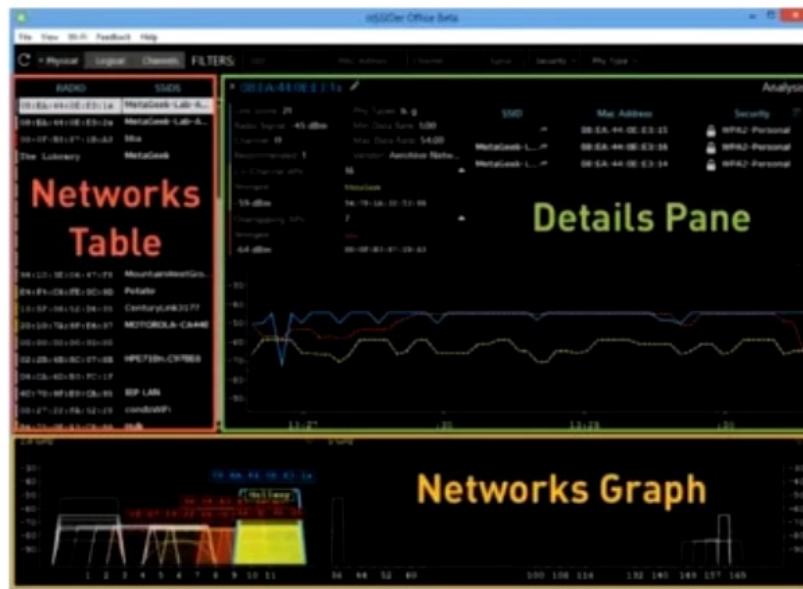

## Active Footprinting Method

In this method, an attacker's wireless device **sends out a probe request with the SSID** to see if an AP responds; if the wireless device does not have the SSID at the beginning, it will send the probe request with an empty SSID

# Wi-Fi Discovery: Finding Wi-Fi Networks in Range to Attack

- The first task an attacker will go through when searching for Wi-Fi targets is **checking the potential networks** that are in range to find the best one to attack
- Drive around with Wi-Fi enabled laptop installed with a wireless discovery tool such as **inSSIDer** and map out active wireless networks

<https://www.metageek.com>

<https://nutsaboutnets.com>

## Other Wi-Fi Discovery Tools:

**Wi-Fi Scanner**  
<https://lizardsystems.com>

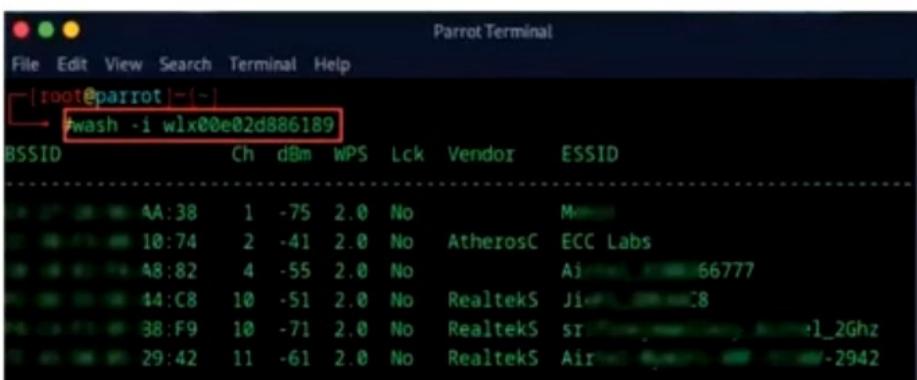

**Acrylic WiFi Heatmaps**  
<https://www.acrylicwifi.com>

**WirelessMon**  
<https://www.passmark.com>

**Ekahau Wi-Fi Heatmaps**  
<https://www.ekahau.com>

# Wi-Fi Discovery: Finding WPS-Enabled APs

- Attackers use **Wash utility** to identify the WPS-enabled APs and detect if the AP is in locked or unlocked state
- Most of the WPSs in the routers usually lock when brute-forced for more than five times and can be unlocked only in the administrator interface of the router manually
- The Wash command can support the 5 GHz channel
- The attacker **discovers the AP, ESSID, and BSSID of a device or router** using the following wash command
  - # sudo wash -i wlan0

Parrot Terminal

```
root@parrot:~(.-)
wash -i wlx00e02d886189
```

BSSID	Ch	dBm	WPS	Lck	Vendor	ESSID
AA:38	1	-75	2.0	No		Me
10:74	2	-41	2.0	No	AtherosC	ECC Labs
48:82	4	-55	2.0	No		Aj
44:C8	10	-51	2.0	No	RealtekS	Jie
38:F9	10	-71	2.0	No	RealtekS	sr
29:42	11	-61	2.0	No	RealtekS	Air

# Wireless Traffic Analysis

- Wireless traffic analysis enables attackers to **identify vulnerabilities** and susceptible victims in a target wireless network
- Attackers analyze a wireless network to **determine the broadcast SSID**, presence of multiple access points, possibility of recovering SSIDs, authentication method used, WLAN encryption algorithms, etc.
- Attackers use **Wi-Fi packet analyzer tools**, such as AirMagnet™ G3 Pro, Wireshark, OmniPeek, and CommView for Wi-Fi, to capture and analyze the traffic of a target wireless network

# Choosing the Optimal Wi-Fi Card

- Selecting the ideal Wi-Fi card for Wi-Fi hacking requires **choosing hardware that supports essential features** for Wi-Fi hacking
- **Choosing the optimal Wi-Fi card** is very important for an attacker as certain tools, such as Aircrack-ng and KisMAC, only work with selected wireless chipsets

**Factors to consider when choosing the optimal Wi-Fi card:**

- ① Determine the Wi-Fi requirements
- ② Learn the capabilities of a wireless card
- ③ Determine the chipset of the Wi-Fi card
- ④ Verify the chipset capabilities
- ⑤ Determine the drivers and patches required

# Launch of Wireless Attacks: Aircrack-ng Suite

- Aircrack-ng is a **network software suite** consisting of a detector, packet sniffer, WPA PSK (WPA 1 and 2) cracker, and an analysis tool for 802.11 wireless networks; the program runs in Linux and Windows

<b>Airbase-ng</b>	Captures WPA/WPA2 handshake and can act as an ad-hoc AP	<b>Aireplay-ng</b>	Effective for gathering WEP IVs and WPA handshakes
<b>Aircrack-ng</b>	De facto WEP and WPA/WPA2-PSK cracking tool	<b>Airmon-ng</b>	Used to enable monitor mode on wireless interfaces from managed mode and vice versa
<b>Airdecap-ng</b>	Decrypts WEP/WPA/WPA2 and can be used to strip the wireless headers from Wi-Fi packets	<b>Airodump-ng</b>	Used to capture packets of raw 802.11 frames and collect WEP IVs
<b>Airdrop-ng</b>	Used for targeted, rule-based de-authentication of users	<b>Airolib-ng</b>	Stores and manages ESSID and password lists used in WPA/WPA2 cracking

<https://www.aircrack-ng.org>

# Launch of Wireless Attacks: Detection of Hidden SSIDs

```
Parrot Terminal
File Edit View Search Terminal Help
[root@parrot ~]# airmon-ng start wlx00e02d886189
```

```
Parrot Terminal
File Edit View Search Terminal Help
[root@parrot ~]# airodump-ng wlx00e02d886189
```

Step 1: Run airmon-ng in monitor mode

Step 2: Start airodump-ng to discover SSIDs on interface

SSID Bruteforce Mode activated!

channel set to: 2  
Waiting for beacon frame from target...  
Sniffer thread started

Found SSID length 0, no information about real SSIDs length available.

All 26 possible SSIDs with length 1 sent, trying length 2.

All 676 possible SSIDs with length 2 sent, trying length 3.

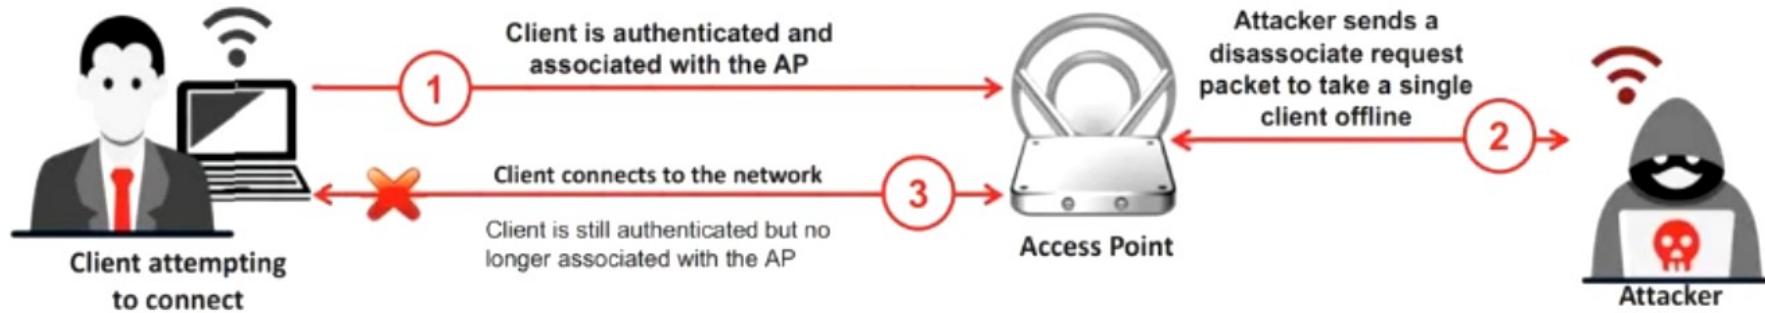

Got response from 00:0c:29:1c:3b:f3:40:10:74, SSID: "ECC Labs"  
Last try was: volea

All 17576 possible SSIDs with length 3 sent, trying length 4.

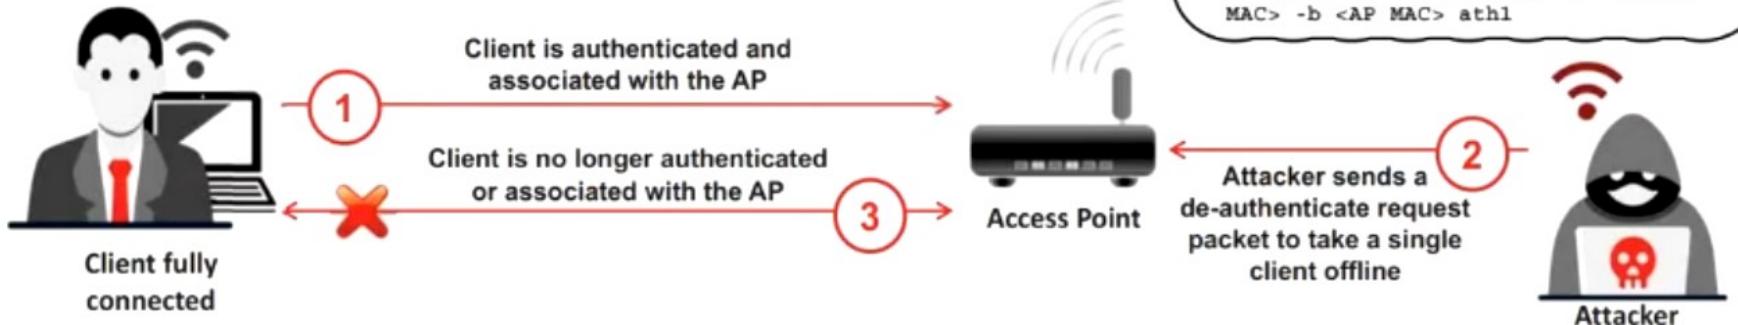

Got response from 1c:3b:f3:40:10:74, SSID: "ECC Labs"  
Last try was: volea

Step 3: De-authenticate the client using Aireplay-ng

C:\>aireplay-ng -1 0 -e SECRET\_SSID -a 1e:64:51:3b:ff:3e -h 02:24:2B:CD:68:EE eth1

22:25:10 Waiting for beacon frame (BSSID: 1E:64:51:3B:FF:3E) on channel 11  
22:25:10 Sending Authentication Request  
22:25:10 Authentication successful  
22:25:10 Sending Association Request  
22:25:10 Association successful :-)

Step 4: Associate your wireless card (fake association) with the AP you are accessing with aireplay-ng

# Launch of Wireless Attacks: MAC Spoofing Attack

- In Media Access Control (MAC) spoofing, attackers **change the MAC address** to that of an authenticated user to bypass the MAC filtering configured in an AP
- To spoof a MAC address, the attacker needs to set the value returned from ifconfig to **another hex value** in the format of aa:bb:cc:dd:ee:ff
- Attackers use MAC spoofing tools, such as **Technitium MAC Address Changer** and LizardSystems Change MAC Address tool, to change the MAC address

The screenshot shows a terminal window titled "Linux Shell". It displays the following commands:

```
[root@localhost root]# ifconfig wlan0 down
[root@localhost root]# ifconfig wlan0 hw ether 02:25:ab:4c:2a:bc
[root@localhost root]# ifconfig wlan0 up
```

Annotations with arrows point to specific parts of the terminal output:

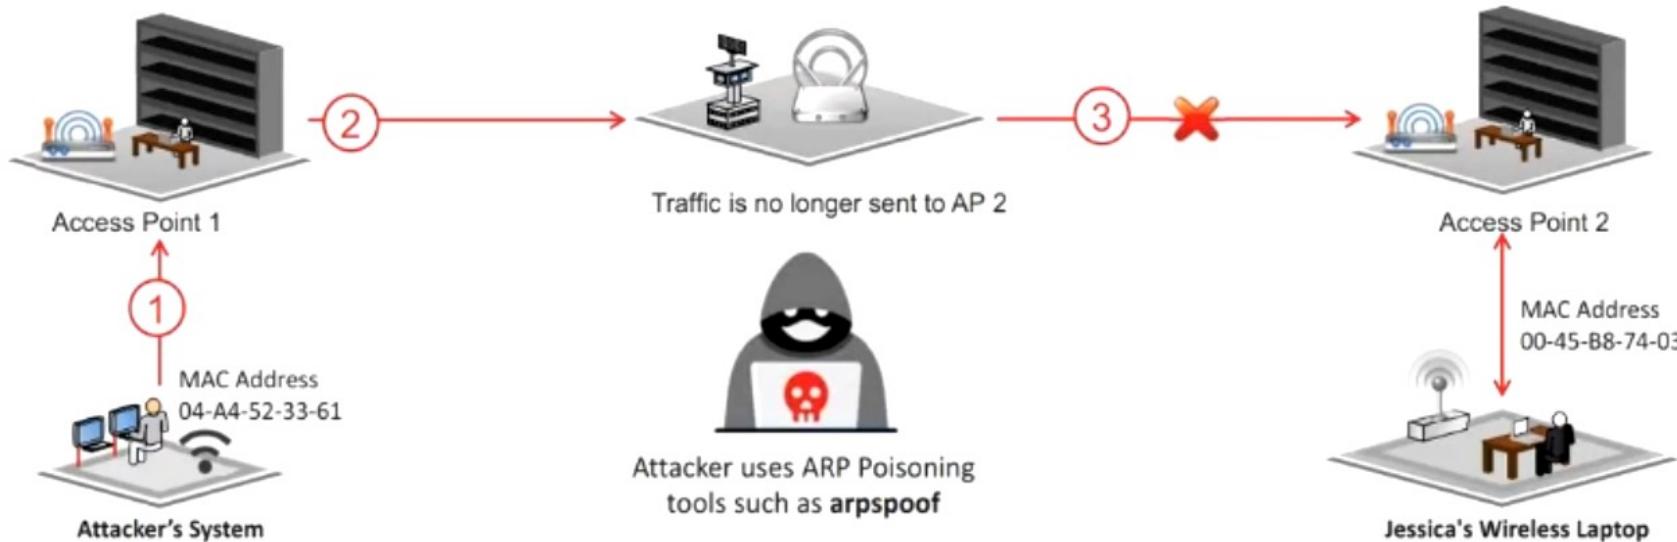

- An arrow points to the first command ("ifconfig wlan0 down") with the text "Logging as root and disable the network interface".
- An arrow points to the second command ("ifconfig wlan0 hw ether 02:25:ab:4c:2a:bc") with the text "Enter the new MAC address".
- An arrow points to the third command ("ifconfig wlan0 up") with the text "Bring the interface back up".

## Technitium MAC Address Changer

Technitium MAC Address Changer allows you to change (spoof) the **MAC Address** of your **Network Interface Card (NIC)** instantly

# Launch of Wireless Attacks: Wireless ARP Poisoning Attack

1

Attacker spoofs the MAC address of Jessica's wireless laptop and attempts to authenticate to AP1

2

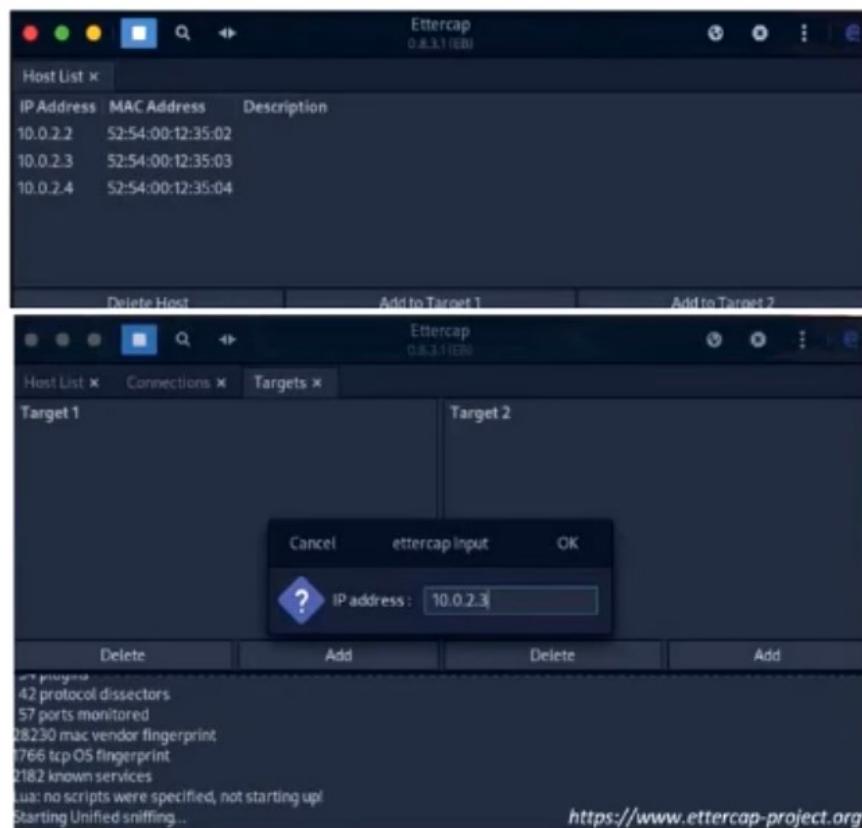

AP1 sends updated MAC address info to the network routers and switches, which in turn update their routing and switching tables

3

Traffic now destined from the network backbone to Jessica's system is no longer sent to AP2

# ARP Poisoning Attack Using Ettercap

- Launch Ettercap and enable the unified sniffing option by selecting **Sniff → Unified Sniffing** from the menu bar
- In the Ettercap **Setup** pop-up window, set the **Primary interface** to sniff and then click **OK**
- Select **Hosts → Scan for Hosts**. Ettercap performs a scan of all the live hosts in the network and displays the host list
- Select **Hosts → Hosts List** to view all the hosts discovered on the local network
- Select **View → Connections** to start snooping on the identified connections
- Go to the **Hosts** window and select the target IP address. Then, select **Targets → Current targets** to add a list of target hosts
- Navigate to the **MITM** menu and select **MITM → ARP poisoning**. A pop-up window appears. Select the **Sniff remote connections** option and click **OK** to launch an ARP poisoning attack

# Launch of Wireless Attacks: Rogue APs

A rogue AP **provides backdoor access** to the target wireless network

## Scenarios for Rogue AP Installation and Setup

- A **compact, pocket-sized rogue AP** device plugged into an Ethernet port of a corporate network
- A **rogue AP device** connected to corporate networks over a Wi-Fi link
- A **USB-based rogue AP** device plugged into a corporate machine
- A **software-based rogue AP** running on a corporate Windows machine

## Steps to Deploy a Rogue AP

- Choose an **appropriate location** to plug in your rogue AP that allows maximum coverage from your connection point
- Disable the **SSID Broadcast** (silent mode) and any management features to avoid detection
- Place the AP behind a **firewall**, if possible, to avoid network scanners
- Deploy a **rogue AP** for a short period

# Creation of a Rogue AP Using MANA Toolkit

**Step 1** Modify the **hostapd-mana.conf** MANA's configuration file using any text editor to setup a fake AP

**Step 2** Modify the **start-nat-simple.sh** script used to launch the rogue AP

**Step 3** Execute the script file **start-nat-simple.sh** using the bash command

**Step 4** After the rogue AP is up, use a Windows machine or mobile device (having a different wireless card) to connect to the rogue AP

**Step 5** In the Wi-Fi enabled device, search for the Internet connection that is not password-protected and connect to it

**Step 6** All the data packets from your machine flow through the rogue AP; now, you can use tools, such as **tcpdump** and Wireshark, to capture and analyze the packets

# Launch of Wireless Attacks: Evil Twin

Evil Twin is a **wireless AP** that pretends to be a **legitimate AP** by replicating another network name

Attackers set up a **rogue AP outside the corporate perimeter** and lures users to sign into the wrong AP

Once associated, users may **bypass the enterprise security policies**, giving attackers access to network data

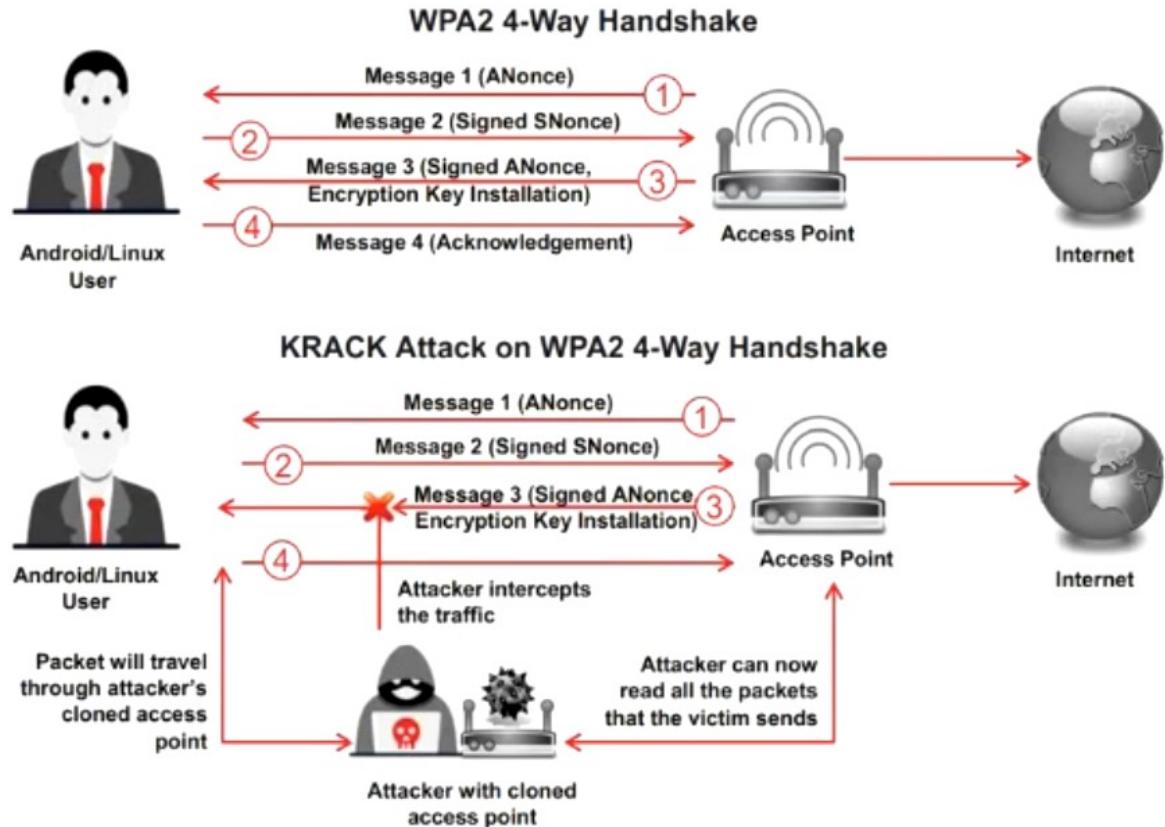

Evil Twin can be configured with a **common residential SSID**, hotspot SSID, or a company's WLAN SSID

Wi-Fi is everywhere these days and so are your employees who take their laptops to Starbucks, FedEx Office, and the airport; how do you keep the company data safe?

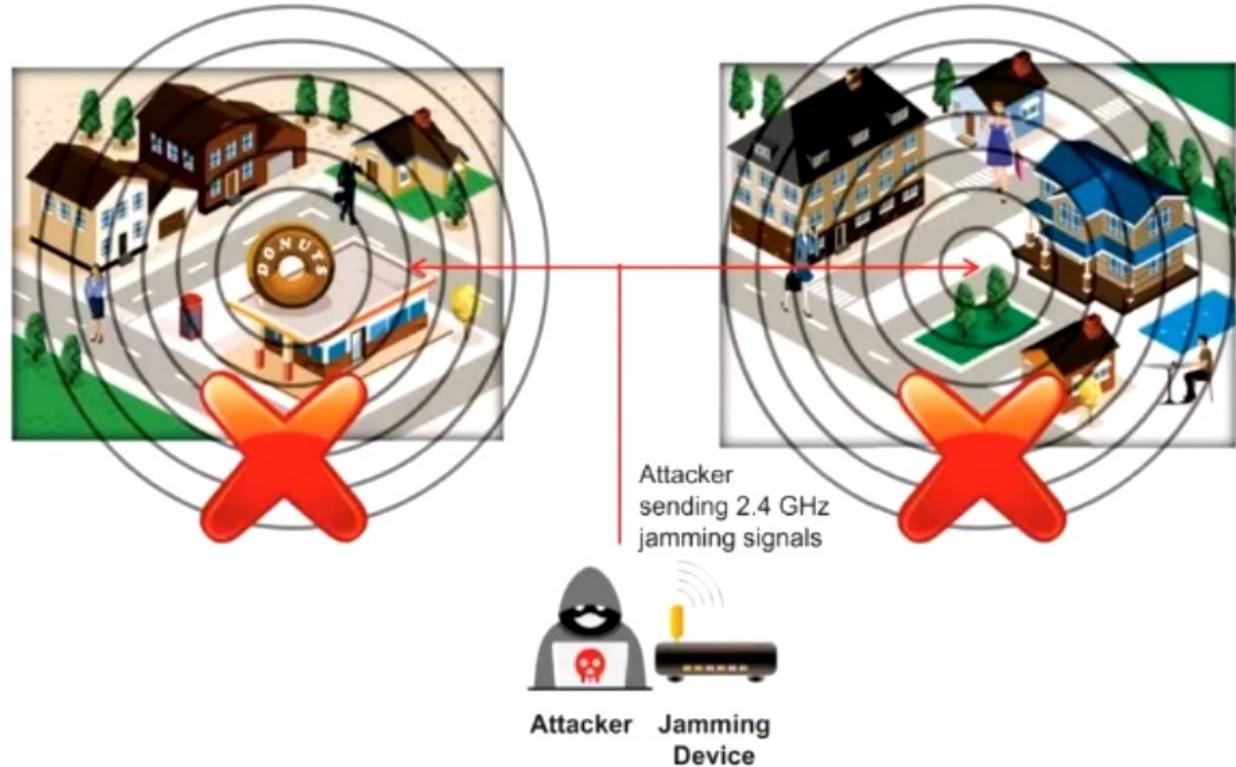

# Launch of Wireless Attacks: Key Reinstallation Attack (KRACK)

- All secure Wi-Fi networks use the **4-way handshake process** to join the network and generate a **fresh encryption key** that will be used to encrypt the network traffic
- The KRACK attack works by exploiting the 4-way handshake of the **WPA2 protocol** by forcing Nonce reuse
- KRACK works against all **modern protected Wi-Fi networks** and allows attackers to steal sensitive information, such as credit card numbers, passwords, chat messages, emails, and photos

# Launch of Wireless Attacks: Jamming Signal Attack

- All wireless networks are prone to jamming
- This jamming signal causes a DoS because **802.11 is a CSMA/CA protocol** whose collision avoidance algorithms require a period of silence before a radio is allowed to transmit
- An attacker stakes out the area from a nearby location with a **high-gain amplifier** drowning out the legitimate AP
- Users simply cannot get through to log in or they are **knocked off** their connections by the overpowering nearby signals

# Wi-Fi Jamming Devices

## PCB-4510 Jammer

- Range: 50–150 m
- 10 Antennas
- 10 Antennas bands jammed (GSM, 3G, UMTS, 4G, WiFi, GPS, 5G)
- Working time: 1- 2 Hours

## CPB-2920 Jammer

- Range: 10–40m
- 20 Antennas
- 20 frequency bands jammed (CDMA, DCS, PCS, 3G, UMTS, 4G, 5G..)
- Working time: No time limit

## CPB-2612H-5G Jammer

- Range: 20–60 m
- 12 Antennas
- 12 frequency bands jammed (5G, 4G, GSM, 3G, UMTS, WiFi, UHF, VHF..)
- Working time: No time limit

## CPB-2080-5G Jammer

- Range: 10–40 m
- 8 Antennas
- 8 frequency bands jammed (5G, 4G LTE, 3G, UMTS, WiFi..)
- Working time: No time limit

## PCB-2112 Jammer

- Range: 20–50 m
- 12 Antennas
- 12 Antennas bands jammed (CMDA, DCS, 3G, WiFi, 4GLTE, 5G, GPS..)
- Working time: 60-80 Min

## PCB-1016 Jammer

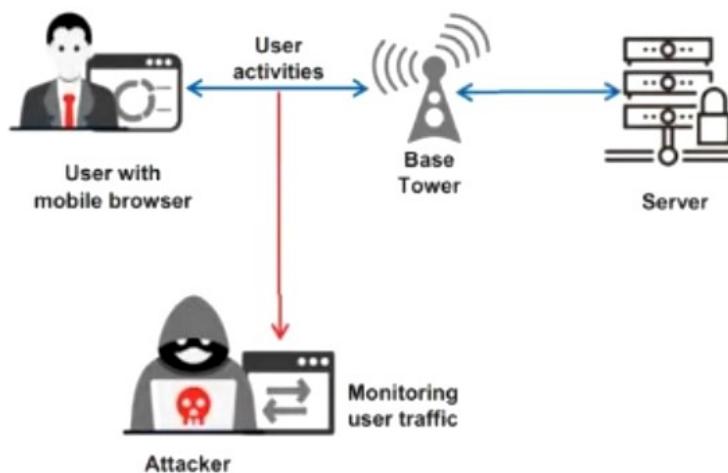

- Range: 10–30 m
- 16 Antennas
- 16 Antennas bands jammed (CDMA, DCS, 3G, 4G, WiFi, GPS, 5G..)
- Working time: 3.0 Hours

# Launch of Wireless Attacks: aLTEr Attack

Attacker installs a **virtual (fake) communication tower** between two authentic endpoints intending to mislead the victim. This virtual tower is used to **interrupt the data transmission** between the user and real tower attempting to **hijack the active session**

## Information Gathering Phase

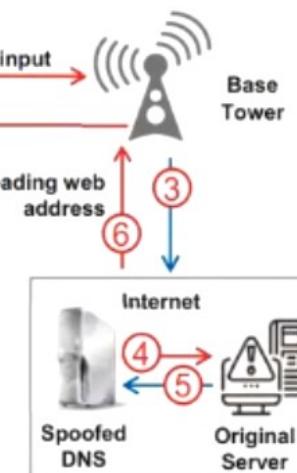

Attackers passively gather information needed to perform aLTEr attack using techniques, such as **identity mapping** and website fingerprinting

## Attack Phase

Attackers use the information gathered to perform an active attack using techniques, such as **DNS spoofing**

### User with LTE device

Here, spoofed DNS requests malicious website link to the main server

# Launch of Wireless Attacks: Wi-Jacking Attack

**Step 1** Send **deauth requests** to the victim's device using aireplay-ng to disconnect the victim from his/her legitimate Wi-Fi network

**Step 2** Now, perform Karma attack using **hostapd-wpe**, thus luring the victim to connect to the malicious Wi-Fi network

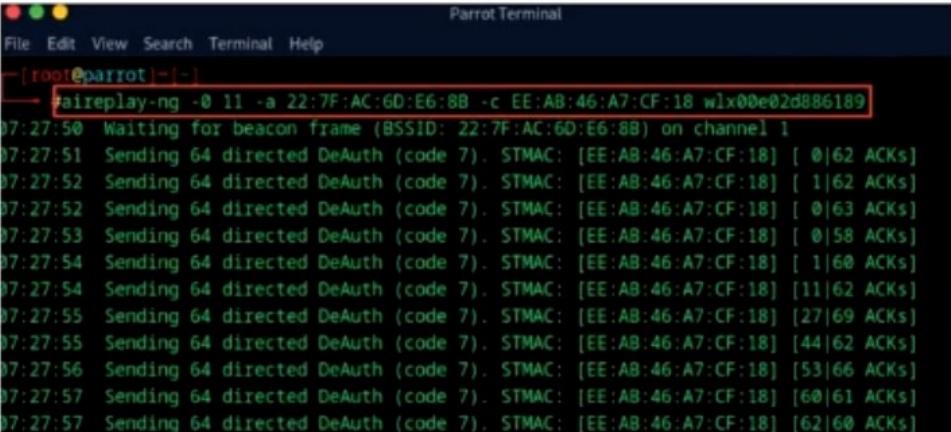

**Step 3** Use tools, such as **dnsmasq** and python scripts, to inject malicious URL and lure the victim's browser to load the malicious URL

**Step 4** Now, **wait for the victim to access the HTTP page**, and at this moment, the victim's router is updated and restarts automatically

**Step 5** Once the victim opens the malicious page, the **browser will automatically load the page**, which has stored credentials

**Step 6** Now, stop the Karma attack, and **allow the victim to connect back to his/her legitimate network**; the malicious page remains in the router's admin interface origin along with admin credentials loaded into the JavaScript

**Step 7** Use **XMLHttpRequest** to login to the router to extract the victim's WPA2 PSK and further perform any other required malicious changes

```

```

# Launch of Wireless Attacks: RFID Cloning Attack

- RFID cloning involves **capturing the data** from a legitimate RFID tag and then **creating its clone** using a new chip
- Attackers use tools such as **iCopy-X** and **RFIDler** to clone RFID tags

**iCopy-X**

iCopy-X is an entirely stand-alone and portable RFID cloning device that can be used by attackers to **clone RFID tags**

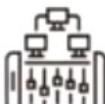

## Additional RFID Cloning Tools

**RFIDler**

<https://icopyx.com>

# Wi-Fi Encryption Cracking: WPA/WPA2 Encryption Cracking

## WPA PSK

WPA PSK uses a **user-defined password** to initialize the TKIP, which is not crackable as it is a per-packet key, but the keys can be brute-forced using dictionary attacks

## Offline Attack

You only required to be near the AP for a matter of seconds to capture the **WPA/WPA2 authentication handshake**; by capturing the right type of packets, you can **crack the WPA keys offline**

## De-authentication Attack

Force the connected client to disconnect. Then, capture the re-connect and authentication packets using tools, such as aireplay; you should be able to re-authenticate in a few seconds. Then **attempt to dictionary brute-force the PMK**

## Brute-Force WPA Keys

You can use tools, such as **aircrack** and **aireplay** to brute-force WPA Keys

# Cracking WPA/WPA2 Using Aircrack-ng

Parrot Terminal

```
[root@parrot:~]# airmon-ng start wlx00e02d886189
```

1. Run airmon-ng in monitor mode

Parrot Terminal

```
[root@parrot:~]# airodump-ng wlx00e02d886189
```

2. Run airodump-ng command to get a list of detected access points

Parrot Terminal

Parrot Terminal

```
[root@parrot:~]# airodump-ng --bssid 22:7F:AC:6D:E6:8B -c 1 -w ECCLabs wlx00e02d886189
```

3. Run airodump-ng command to capture the packets from the targeted access point

Parrot Terminal

```
[root@parrot:~]# aireplay-ng -0 11 -a 22:7F:AC:6D:E6:8B -c EE:AB:46:A7:CF:18 wlx00e02d886189
```

4. Run aireplay-ng command to send de-authentication packets

Parrot Terminal

```
[root@parrot:~]# aireplay-ng -0 11 -a 22:7F:AC:6D:E6:8B -c EE:AB:46:A7:CF:18 wlx00e02d886189
07:27:50 Waiting for beacon frame (BSSID: 22:7F:AC:6D:E6:8B) on channel 1
07:27:51 Sending 64 directed DeAuth (code 7). STMAC: [EE:AB:46:A7:CF:18] [ 0 ] 62 ACKs
07:27:52 Sending 64 directed DeAuth (code 7). STMAC: [EE:AB:46:A7:CF:18] [ 1 ] 62 ACKs
07:27:52 Sending 64 directed DeAuth (code 7). STMAC: [EE:AB:46:A7:CF:18] [ 0 ] 63 ACKs
```

5. Run aircrack-ng command with a password.txt file against captured .cap file

Parrot Terminal

```
[root@parrot:~]# aircrack-ng -a2 22:7F:AC:6D:E6:8B -w password.txt ECCLabs-01.cap
```

6. The result of aircrack-ng command showing the cracked key as KEY FOUND!

Aircrack-ng 1.7

[00:00:00] 8/16 keys tested (1201.02 k/s)

Time left: 0 seconds 50.00%

KEY FOUND! [ 12345678 ]

# WPA Brute Forcing Using Fern Wifi Cracker

**Step 1:** Run `sudo fern-wifi-cracker` command to start the Fern WiFi Cracker tool

**Step 2:** Enable the monitor mode by selecting the Wi-Fi adapter from the drop-down menu and clicking on the "**Monitor Mode**" button

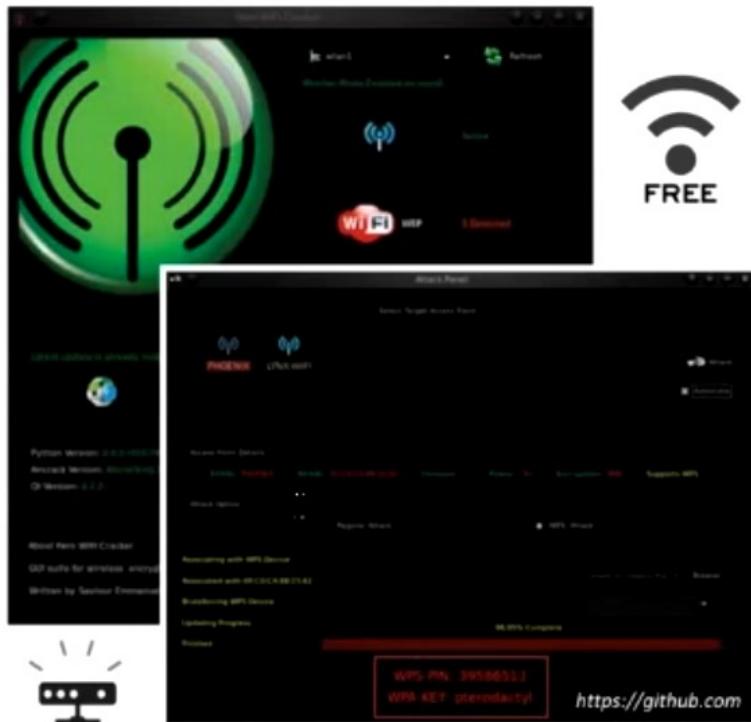

**Step 3:** Click on the "**Scan for Access points**" button to start scanning for Wi-Fi Networks and select a target WPA/WPA2 network

**Step 4:** Initiate a **de-authentication attack** by clicking on the "Attack" button next to the target network to start de-authenticating clients

**Step 5:** The tool will notify you once it successfully **captures a WPA handshake**

**Step 6:** Choose a **wordlist file** containing potential passwords to try against the captured handshake

**Step 7:** Click on the "**Start WPA Attack**" button. If the correct password is found, it will display the password on the screen

# WPA3 Encryption Cracking

- Dragonblood is a set of **vulnerabilities** in the **WPA3** security standard that allows attackers to **recover keys**, **downgrade security mechanisms**, and launch various information-theft attacks
- Attackers can use various tools, such as **Dragonslayer**, **Dragonforce**, **Dragondrain**, and **Dragontime**, to exploit these vulnerabilities and launch attacks on WPA3-enabled networks

## Downgrade Security Attacks

- Exploiting Backward Compatibility**
  - An attacker installs a rogue AP and forces the user to involve in WPA2 encryption
  - Then, the attacker performs all the attacking techniques available to exploit WPA2
- Exploiting the Dragonfly Handshake**
  - An attacker with a rogue AP discards the user's WPA3 Dragonfly mechanism
  - The attacker forces the user to use a weaker encryption algorithm, such as WPA2, and exploits WPA2

## Side-channel Attacks

- Timing-Based**
  - An attacker analyzes the amount of time dragonfly handshake takes for certain password authentications
  - The attacker notices the number of iterations the encoding process takes and short-lists the passwords to launch further attacks
- Cache-Based**
  - An attacker installs malicious JavaScript code on the client's browser and observes memory access patterns
  - The attacker retrieves the passwords to perform malicious actions with the user's credentials

# Cracking WPA3 Using Aircrack-ng and hashcat

**Step 1:** Set the wireless interface to monitor mode by running the following command:

```
airmon-ng start <Wireless_Interface>
```

**Step 2:** Run the following airodump-ng command as the root user in another terminal to capture the handshake:

```
airodump-ng wlan0mon
```

**Step 3:** De-authenticate a client to capture the handshake by running the following aireplay-ng command:

```
aireplay-ng --deauth 10 -a <BSSID> -c <Client_MAC> wlan0mon
```

**Step 4:** Convert the captured .cap file to .hccapx format using hcxtools by running:

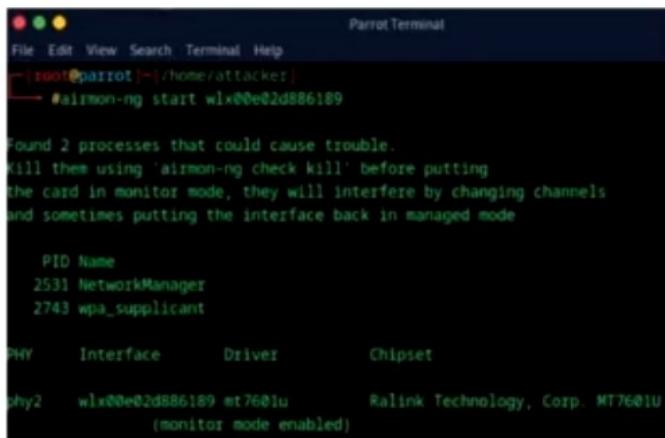

```
hcxpcapngtool -o capture.hccapx <capture>.cap
```

**Step 5:** Finally, crack the handshake using hashcat with a wordlist file:

```
hashcat -m 22000 capture.hccapx </path/to/wordlist.txt>
```

# Cracking WPS Using Reaver

**Step 1:** Setup your wireless interface in monitoring mode using **airmon-ng**

```
Parrot Terminal
File Edit View Search Terminal Help
[+] root@parrot:~/home/attacker
└─# airmon-ng start wlan0e0d886189

Found 2 processes that could cause trouble.
Kill them using 'airmon-ng check kill' before putting
the card in monitor mode, they will interfere by changing channels
and sometimes putting the interface back in managed mode

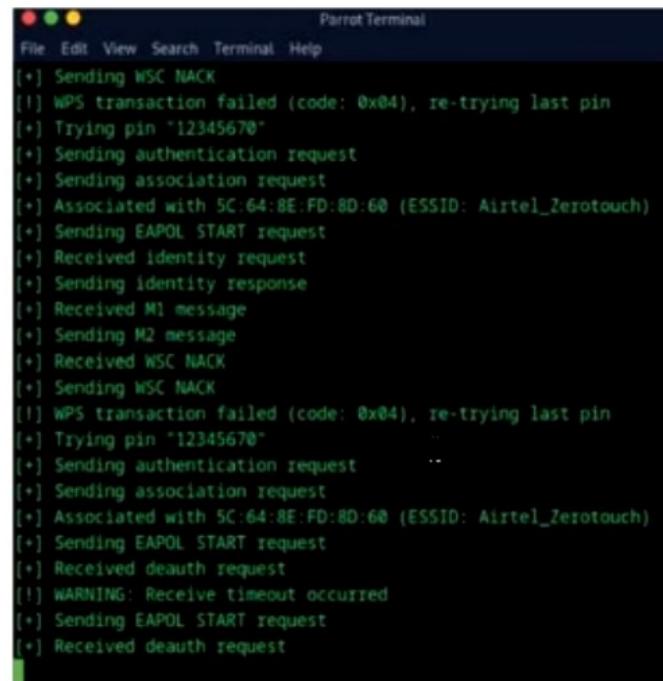

PID Name
2531 NetworkManager
2743 wpa_supplicant

PHY Interface Driver Chipset
wlan0e0d886189 mt7601u Ralink Technology, Corp. MT7601U
(monitor mode enabled)
```

**Step 2:** Use **wash** utility to detect WPS-enabled devices

**Step 3:** If you are unable to detect WPS-enabled devices using **wash**, use **Airodump-ng** to detect devices using WPS

**Step 4:** After identifying the BSSID of the target device, start cracking the WPS PIN using **Reaver**

```

Objective **05**

# Explain Wireless Attack Countermeasures

# Defense Against WPA/WPA2/WPA3 Cracking

## Wireless Attack Countermeasures

- Use a **password** with at least 12-16 characters, including uppercase and lowercase letters, numbers, and special characters
- Disable **TKIP** in the router settings and ensure only AES encryption is used
- Turn off **WPS** in the router settings to prevent brute-force attacks on the WPS PIN
- Check the manufacturer's website regularly for **firmware updates** and apply them promptly
- Limit the **Wi-Fi signal range** to reduce the chances of unauthorized access from outside the premises
- Use **network monitoring tools** to detect and respond to suspicious activities
- Use **WPA3-SAE** wherever possible for all devices that support it
- Disable **transition mode** if all devices support WPA3 to ensure the highest level of security

## Defense Against aLTEr Attack

- Encrypt **DNS queries** and only use trusted DNS resolvers
- Resolve DNS queries using the **HTTPS protocol**
- Use DNS over TLS or DTLS to provide encryption and **integrity-protection** to the DNS traffic
- Implement RFC 7858/RFC 8310 to prevent **DNS spoofing attacks**
- Use **DNSCrypt** protocol to authenticate communication between a DNS client and DNS resolver
- Use strong encryption algorithms such as **AES-256** to ensure that all communications are encrypted end-to-end
- Use **mutual authentication** mechanisms to verify the identity of both parties in the communication process

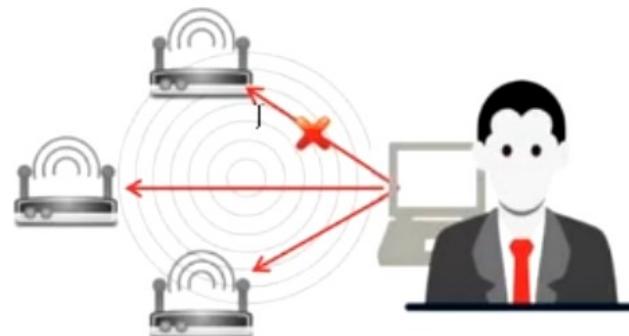

# Detection and Blocking of Rogue APs

## Detection of Rogue APs

- **RF Scanning**
  - Re-purposed APs that perform only packet capturing and analysis (RF sensors) are plugged in all over the wired network to detect and warn the WLAN administrator about any wireless devices operating in the area
- **AP Scanning**
  - APs that can detect neighboring APs operating in close proximity will expose the data through its MIBS and web interface
- **Wired Side Inputs**
  - A network management software uses this technique to detect rogue APs; this software detects devices connected in the LAN, including Telnet, SNMP, and Cisco discovery protocol (CDP), using multiple protocols

## Blocking of Rogue APs

- Deny wireless services to new clients by launching a **denial-of-service attack** (DoS) on the rogue AP
- **Block the switch port** to which an AP is connected or manually locate the AP, and physically pull it off the LAN

# Defense Against Wireless Attacks

## Best Practices for Configuration

- Change the **default SSID** after WLAN configuration
- Set the **router access password** and enable firewall protection
- Disable **SSID broadcasts**
- Disable **remote router login** and wireless administration
- Enable **MAC Address filtering** on your AP or router
- Enable **encryption** on your AP and change passphrase often

## Best Practices for SSID Settings

- Use **SSID cloaking** to keep certain default wireless messages from broadcasting the ID to everyone
- Do not use your SSID, company name, network name, or any **easy-to-guess** string in passphrases
- Place a **firewall or packet filter** between the AP and the corporate Intranet
- Limit the **strength of the wireless network** to avoid being detected outside the bounds of your organization
- Regularly check the wireless devices for **configuration or setup** problems
- Implement an additional technique for **encrypting traffic**, such as IPsec over wireless

## Best Practices for Authentication

- Enable **WPA3** for the highest level of security
- If WPA3 is not supported by your devices, use **WPA2 with AES encryption**
- Use **802.1X authentication** with a RADIUS server for enterprise networks
- Disable the **network** when not required
- Place wireless APs in a **secure location**
- Keep drivers on all wireless equipment **updated**
- Use a centralized server for **authentication**

# Wi-Fi Security Auditing Tools

## Cisco Adaptive Wireless IPS

- Adaptive wireless IPS (WIPS) provides wireless-network **threat detection and mitigation** against malicious attacks
- It provides the ability to **detect, analyze, and identify wireless threats**

The screenshot shows the Cisco Wireless Control System interface. The top navigation bar includes 'Alarms' and 'Search'. The main area displays a search results table for 'alarms' with various columns: 'Severity', 'Alarm Category', 'Time Period', 'Acknowledged State', 'Assigned State', 'Items per page', and 'Save Search'. A sidebar on the left lists 'alarms' and 'events' with their respective counts. At the bottom, there is a URL: <https://www.cisco.com>.

**Other Wi-Fi Security Auditing Tools:**

**RFProtect**

<https://www.arubanetworks.com>

**Fern Wifi Cracker**

<https://github.com>

## Wi-Fi IPSs

### WatchGuard Wi-Fi Cloud WIPS

- WatchGuard Wi-Fi Cloud WIPS defends your airspace from **unauthorized devices, rogue APs, and malicious attacks** and with near-zero false positives

The screenshot shows the WatchGuard Wi-Fi Cloud WIPS interface. The left sidebar has a 'DEVICES' section with a red 'ALARMS' button highlighted. The main area displays a table of detected devices with columns: 'Name', 'Last Seen', 'Address', 'Type', 'Status', and 'Actions'. A URL at the bottom right is: <https://www.watchguard.com>.

**BoopSuite**

<https://github.com>

**Wifite**

<https://github.com>

# Module Summary

- In this module, we have discussed the following:
  - Wireless network concepts and different types of wireless encryption technologies
  - Various wireless threats
  - Wireless hacking methodology, which includes Wi-Fi discovery, wireless traffic analysis, launching wireless attacks, and cracking Wi-Fi encryption
  - Various wireless hacking tools
  - Various countermeasures to prevent wireless network hacking attempts by threat actors
  - How to secure wireless networks using wireless security tools
- In the next module, we will discuss in detail how attackers, as well as ethical hackers and pen-testers, perform mobile hacking to compromise mobile devices
